

MyMovies

MyMovies is an iOS application that allows users to view current popular movies along with leaving reviews and favoriting movies for their profile. When the application initially loads the user is given a choice to sign in, sign up or continue as a guest. The user can sign in/sign up with their email and password through Google Authentication. Once the user signs up/signs in/continues as a guest they are redirected to the movie tableview where all the current popular movies are displayed within a table view. The user has the option of going back to the login screen or viewing their profile page, if the user isn't signed in then the profile page will display a message saying the user must be signed in to view their favorite movies. If the user is signed in the profile page will display a list of their movies in a table when clicked they will be redirected to the movie description page. They can also access the movie description page from the movie table view page. The movie description page contains a backdrop photo of the movie along with the title, a favorite button, a text field for a review, a submit button for the review and a table with all the reviews for the movie. The favorite button and submit button will not be displayed if the user is not logged in, if they are then the buttons will appear and the corresponding review for the movie will be submitted. When the favorite button is clicked then the corresponding movie will be saved for the specific user and will be displayed when they go to their profile page.
